		2. Tall remnant forest on steep gully.									
		3. Tawa - mahoe - rewarewa - (miro) forest on ridge (most outside present reserve boundary).									
		4. Mahoe - tawa - rangiora - pigeonwood scrub on upper slopes.									
		5. Mahoe - gorse shrubland.									
		6. Gorse scrub on hill slope.									
		7. Pines.									
		8. Grassland with scrub regeneration.									
1. Mosaic of primary and secondary forest dominated by kohekohē and mahoe reaching up to 15m. Tawa occurs scattered in the canopy of the main forest type but also as the canopy dominant on some ridges and south facing slopes (1a). Other species occurring in the canopy include pukatea, five finger, black tree fern, rewarewa, kaikomako and nikau. There is a well developed understorey from 1-5m with rangiora, mahoe, kawakawa, red matipo, <i>Coprosma grandifolia</i> , hangehange and <i>Coprosma rhamnoides</i> common. The ground floor contains a well developed fern flora along with sedges and occasional herbaceous plants. Climbers and epiphytes are common.											
2. Small area of tall pukatea/mahoe - tawa forest in a gully and tall rimu and rewarewa on the slopes. The emergent old trees reach 30m in height.											
3. Low forest of tawa - mahoe - rewarewa with occasional miro reaching up to 6m occurs on the upper slope and ridge above the present reserve boundary. The understorey reaching up to 4m consists of shrubs and young trees of <i>Griselinia littoralis</i> , toro, <i>Pseudowintera axillaris</i> , Smith's tree fern, pigeonwood and rangiora. The ground floor is quite sparse but clumps of <i>Blechnum filiforme</i> and hound's tongue fern are present. Supplejack is common throughout.											
4. Wind exposed scrub of mahoe, tawa, rangiora, pigeonwood is found on the upper slopes of the reserve. The vegetation is regenerating after previous forest clearance and areas of reverting pasture are still present. Other species common in this scrub include red matipo, <i>Coprosma grandifolia</i> , rewarewa, <i>Metrosideros fulgens</i> , <i>Coprosma rhamnoides</i> and marbl											
5. Secondary mahoe - gorse shrubland. Establishing shrubs of mahoe and other broadleaved shrubs in gorse canopy. Tawa and ngaio are conspicuous on the periphery.											
6. Young dense growth of gorse on hill slopes which suffer from frequent fires.											
7. Stands of <i>Pinus radiata</i> have been planted as a shelterbelt on the northern and eastern sides of the forest.											
8. Grassland and cocksfoot, Yorkshire fog and perennial rye with mahoe - tawa - ngaio regeneration in gully. There is a small area of manuka and bracken and some forest remnants at the toe of the slope.											
								100.0 156.0			
CONDITION Good.											
FENCING Well fenced on southern boundary. There is a good fence at the western end of the bush above the present reserve boundary.											
PRIORITY Low.											
RATING 0-10 SCIENTIFIC ..4..											
SCENIC ..6..											
RECREATION ..7..											
CONCLUSIONS and RECOMMENDATIONS <p>This reserve along with the adjacent Colonial Knob Scenic Reserve, preserves a significant area of native bush in the Tawa-Porirua Basin. The reserve consists in large part of mainly second growth vegetation following timber milling and forest burning late last century.</p> <p>The reserve boundaries do not follow any natural features and the reserve should be extended to include the upper slopes and top ridge at the western boundary and also to include all the forest in the valley to the north of the reserve. The northern extension would preserve a small area of tall kanuka forest with advanced regeneration of mahoe and kohekohē and an area of regenerating totara and rimu forest.</p>
