CONCLUSIONS and RECOMMENDATIONS																																																																																																																																																																																																																																																																																																																																																																																																																																																																																
An important stand of bush on the Manawatu Plains and one of the few areas of pukatea dominated semi-swamp forest remaining in the region. The reserve also contains a worthwhile area of flax and raupe swamp. Research should be initiated to assess the effects of any change in the water-table on the swamp area and the semi-swamp forest. Esler and Greenwood (1968) describe the swamp as raupe dominated and this is not the case today as flax dominates much of the swamp area. This suggests drying out of the swamp, and a lowered water-table could have serious long term effects on the pukatea forest.																																																																																																																																																																																																																																																																																																																																																																																																																																																																																
Research should be carried out to ascertain the numbers of sambar deer using the bush and to assess their effects on the forest. Sambar deer sign was rife throughout the reserve and even low numbers of deer may be having a significant effect on regeneration in such a small area of bush. An observed lack of pukatea seedlings on the forest floor may or may not be attributed to the deer and this should be ascertained and a suitable eradication programme started.

MAIN HABITATS AND FEATURES (Continued)

4. An area with flax up to 3-4m tall interspersed with the occasional cabbage tree. Cabbage tree is also common around the margins, along with kiekie and young kahikatea. Raupo, *Cyperus ustulatus* and creeping buttercup are present under the flax. Some gorse is present on the drier margins, especially on the southern side adjacent to the pine forest.
5. A wider area than the flax dominated swamp, this area is dominated by raupo up to 3m. tall with some flax and cabbage tree at the drier eastern end. Raupo forms a nearly pure association at the western end.
6. A mosaic of lupin and bracken up to 3m. tall with a few self sown pine trees scattered throughout. Associated species include introduced grasses, most notably tall fescue and cocksfoot.
- 7a. Planted pines on southern sand dune with lupin, bracken, tall fescue and cocksfoot around periphery.
- 7b. This is scattered pine trees (mostly self sown) on sand dunes above lupin, bracken, tall fescue and cocksfoot. Some shrubs and young trees of mahoe are present under and around the pines.
